For Medical Professionals Only

AIMOVIG™ is a prescription medicine used for the preventive treatment of migraine in adults.

New CGRP Therapy Proven to Reduce Days Lost to Migraine

About 50,000 people in Tarrant County are regularly disabled by the pain and nausea of migraine.

We have a new option to reduce their suffering. The monoclonal antibody Erenumab (Aimovig™)¹ is the first migraine drug to target calcitonin gene-related peptide (CGRP) receptors in the brain. CGRP increases existing headache pain.

Aimovig often reduces migraine days 50% or more, even in difficult-to treat populations. These effects last for up to 15 months. The drug is also shown to work faster and generate milder side effects than current preventative medicines.²

Other CGRP-targeting drugs are nearing FDA approval, but Aimovig™ is here. That's good news for your patients who lose days to migraines.

¹The active ingredient in Aimovig is erenumab-aooe. Inactive ingredients are acetate, polysorbate 80, and sucrose. Go to www.aimovig.com for complete prescribing information.

²The most common side effects of AIMOVIG include: pain, redness, or swelling at the injection site and constipation. You may report side effects to the FDA at 1-800- FDA-1088.
