For Medical Professionals Only

AIMOVIG™ is a prescription medicine used for the preventive treatment of migraine in adults.

## New CGRP Therapy Proven to Reduce Days Lost to Migraine

About 50,000 people in Tarrant County are regularly disabled by the pain and nausea of migraine.

We have a new option to reduce their suffering. The monoclonal antibody Erenumab (Aimovig™)<sup>1</sup> is the first migraine drug to target calcitonin gene-related peptide (CGRP) receptors in the brain. CGRP increases existing headache pain.

Aimovig often reduces migraine days 50% or more, even in difficult-to-treat populations. These effects last for up to 15 months. The drug is also shown to work faster and generate milder side effects than current preventative medicines.<sup>2</sup>

Other CGRP-targeting drugs are nearing FDA approval, but Aimovig™ is here. That's good news for your patients who lose days to migraines.

<sup>1</sup>The active ingredient in Aimovig is erenumab-aooe. Inactive ingredients are acetate, polysorbate 80, and sucrose. Go to [www.aimovig.com](http://www.aimovig.com) for complete prescribing information.

<sup>2</sup>The most common side effects of AIMOVIG include: pain, redness, or swelling at the injection site and constipation. You may report side effects to the FDA at 1-800-FDA-1088.
